Language Workbenches

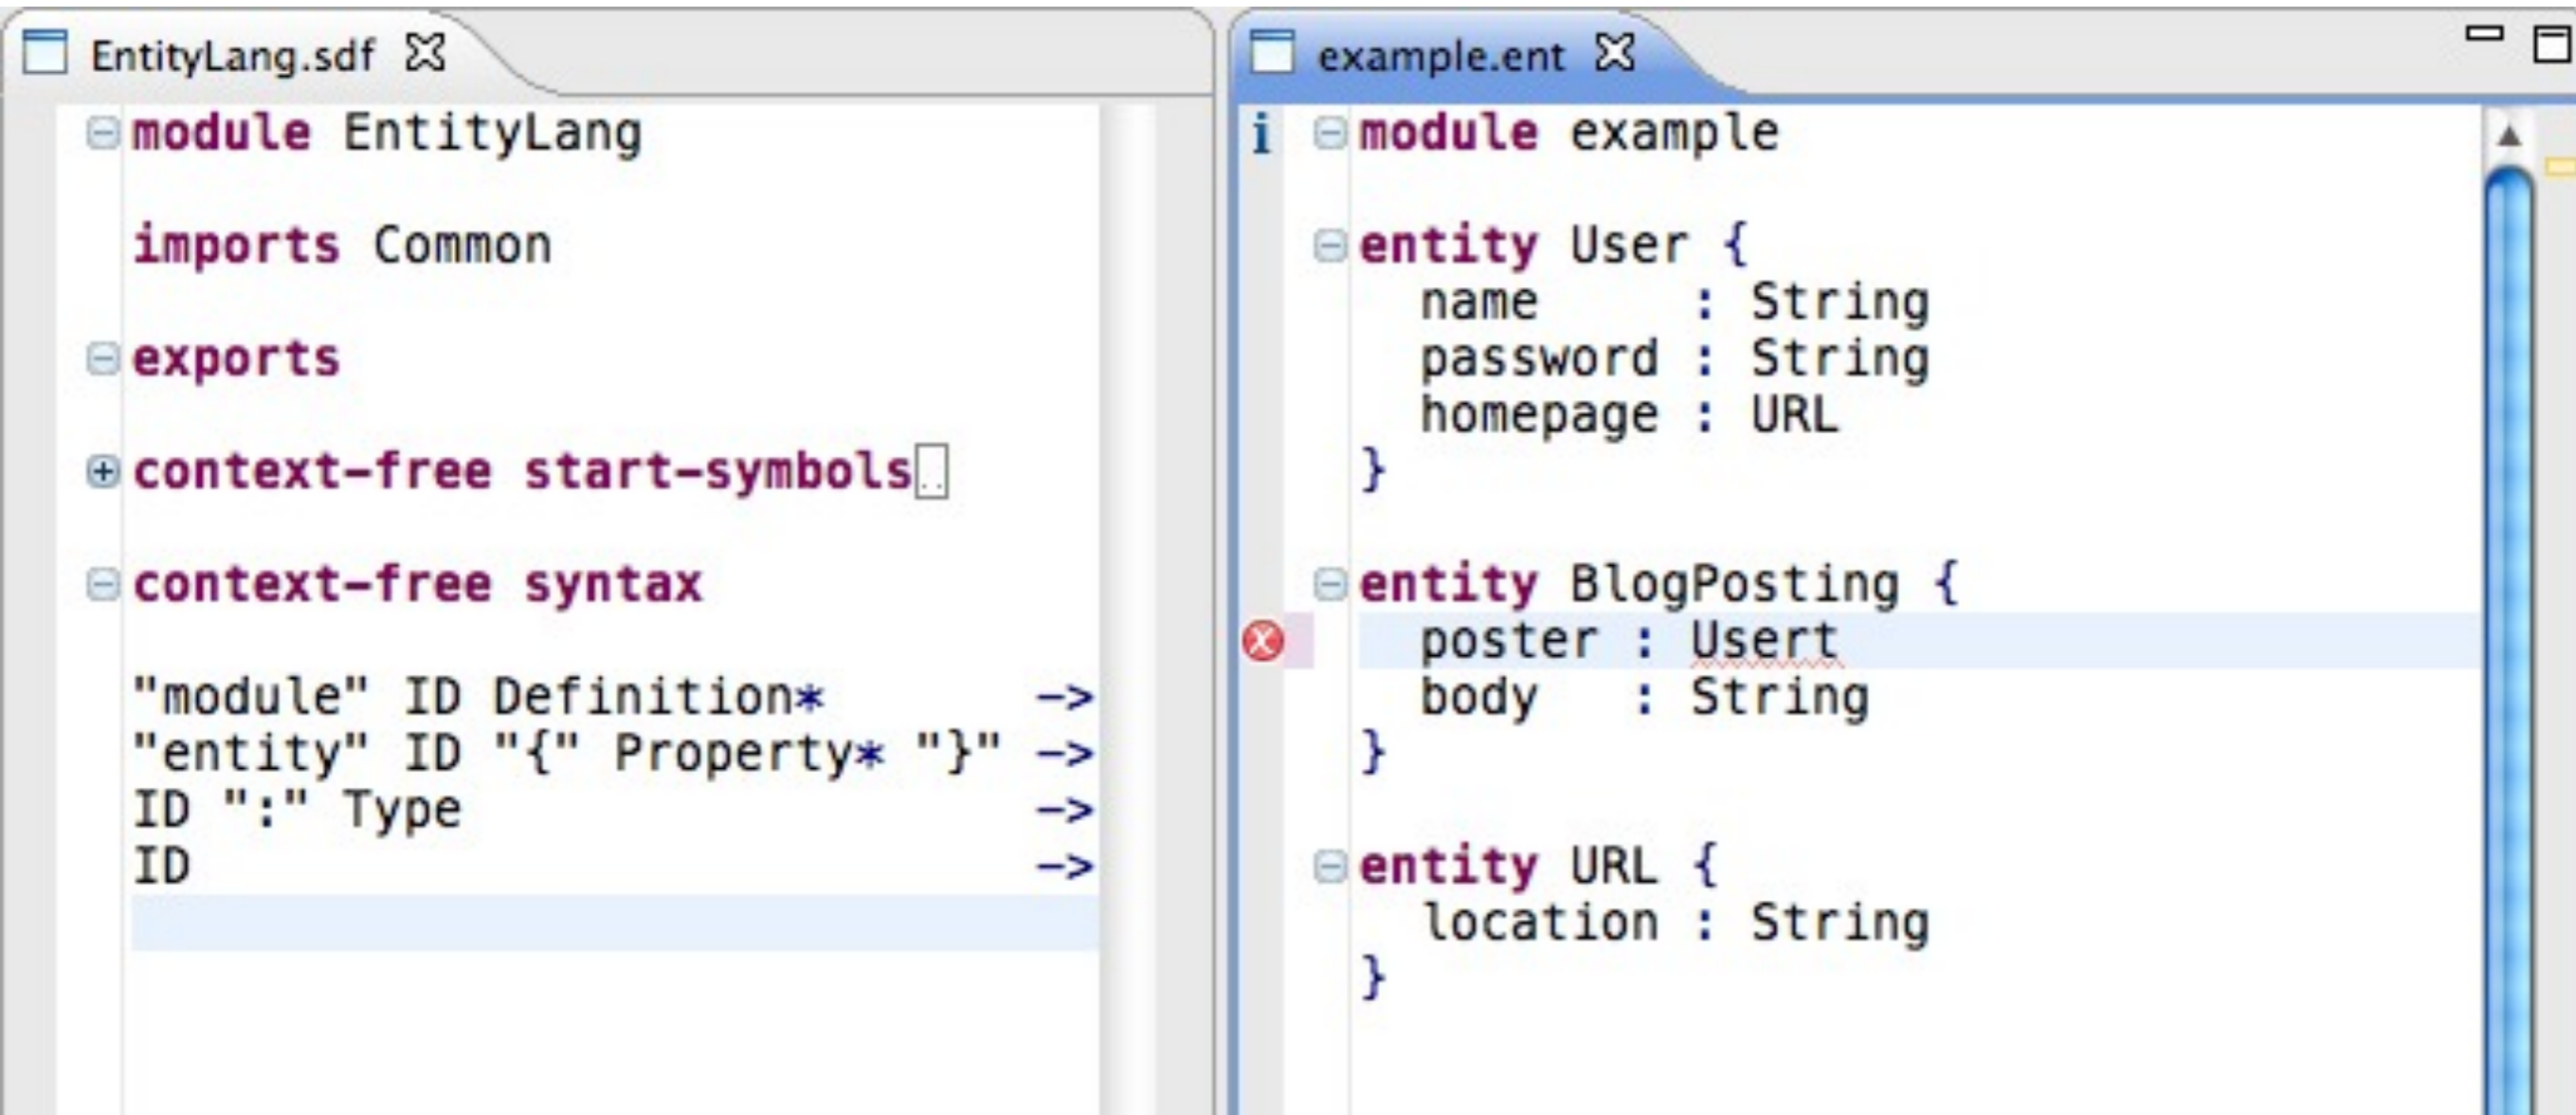

```
EntityLang.sdf
```

- module EntityLang
 - imports Common
 - exports
 - context-free start-symbols
 - context-free syntax
 - "module" ID Definition* ->
 - "entity" ID "{" Property* "}" ->
 - ID ":" Type ->
 - ID ->

```
example.ent
```

- module example
 - entity User {
 - name : String
 - password : String
 - homepage : URL
 - entity BlogPosting {
 - poster : User
 - body : String
 - entity URL {
 - location : String

Testing

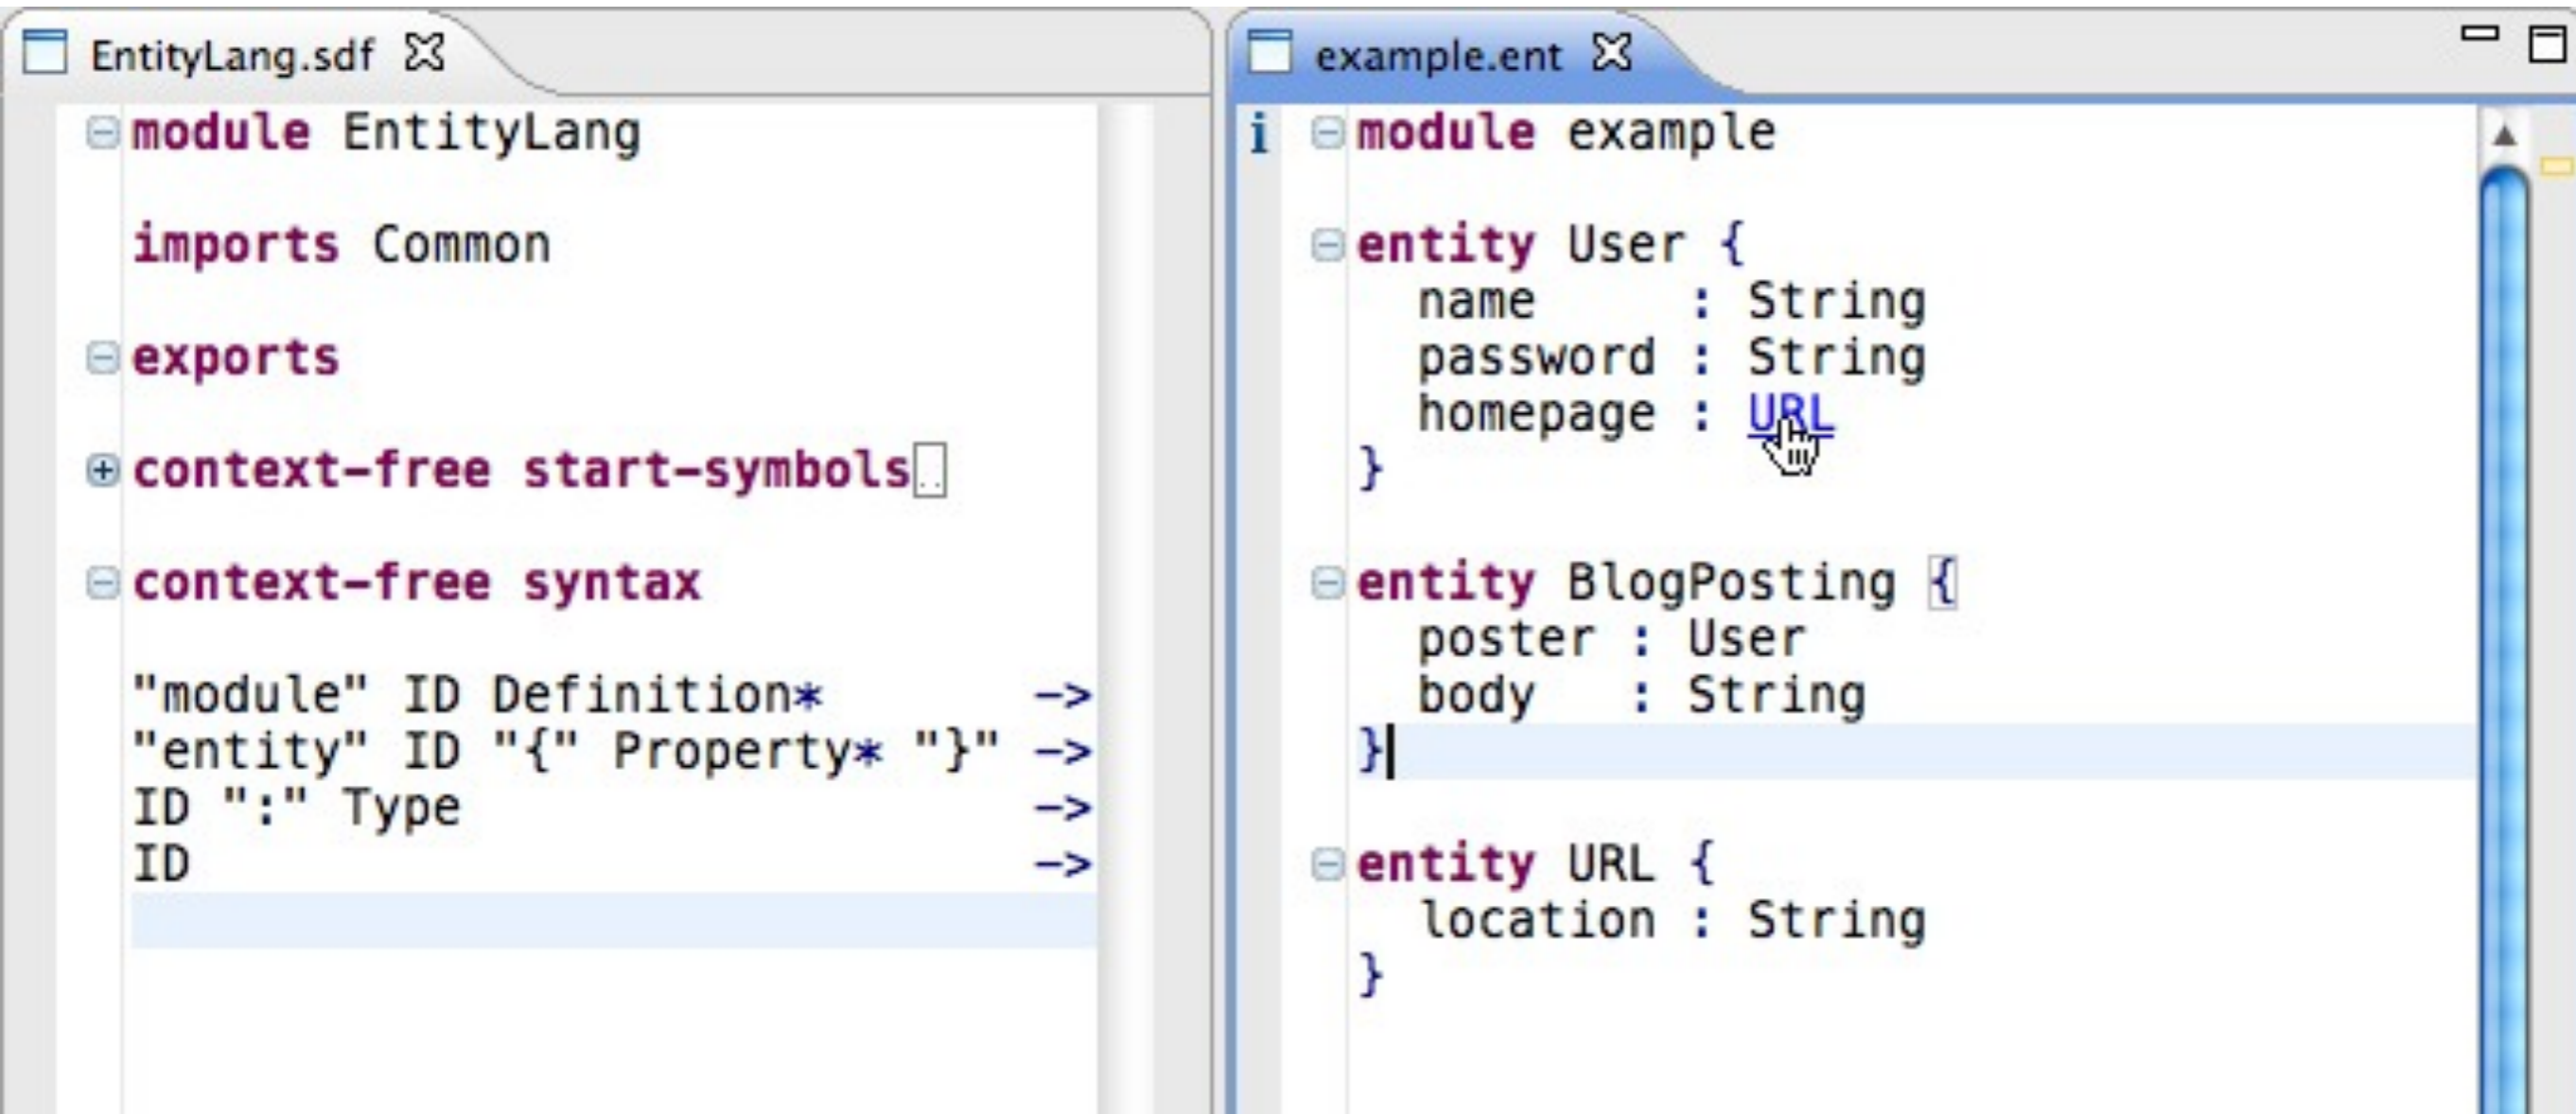

```
EntityLang.sdf
module EntityLang
  imports Common
  exports
  context-free start-symbols
  context-free syntax
  "module" ID Definition* ->
  "entity" ID "{" Property* "}" ->
  ID ":" Type ->
  ID ->

example.ent
i module example
  entity User {
    name : String
    password : String
    homepage : URL
  }
  entity BlogPosting {
    poster : User
    body : String
  }
  entity URL {
    location : String
  }
```

“DOES THE TYPE CHECKER CATCH THIS?”

Testing

The image shows two side-by-side code editors. The left editor, titled 'EntityLang.sdf', contains the following code:

```
module EntityLang
  imports Common
  exports
  context-free start-symbols
  context-free syntax

  "module" ID Definition* ->
  "entity" ID "{" Property* "}" ->
  ID ":" Type ->
  ID ->
```

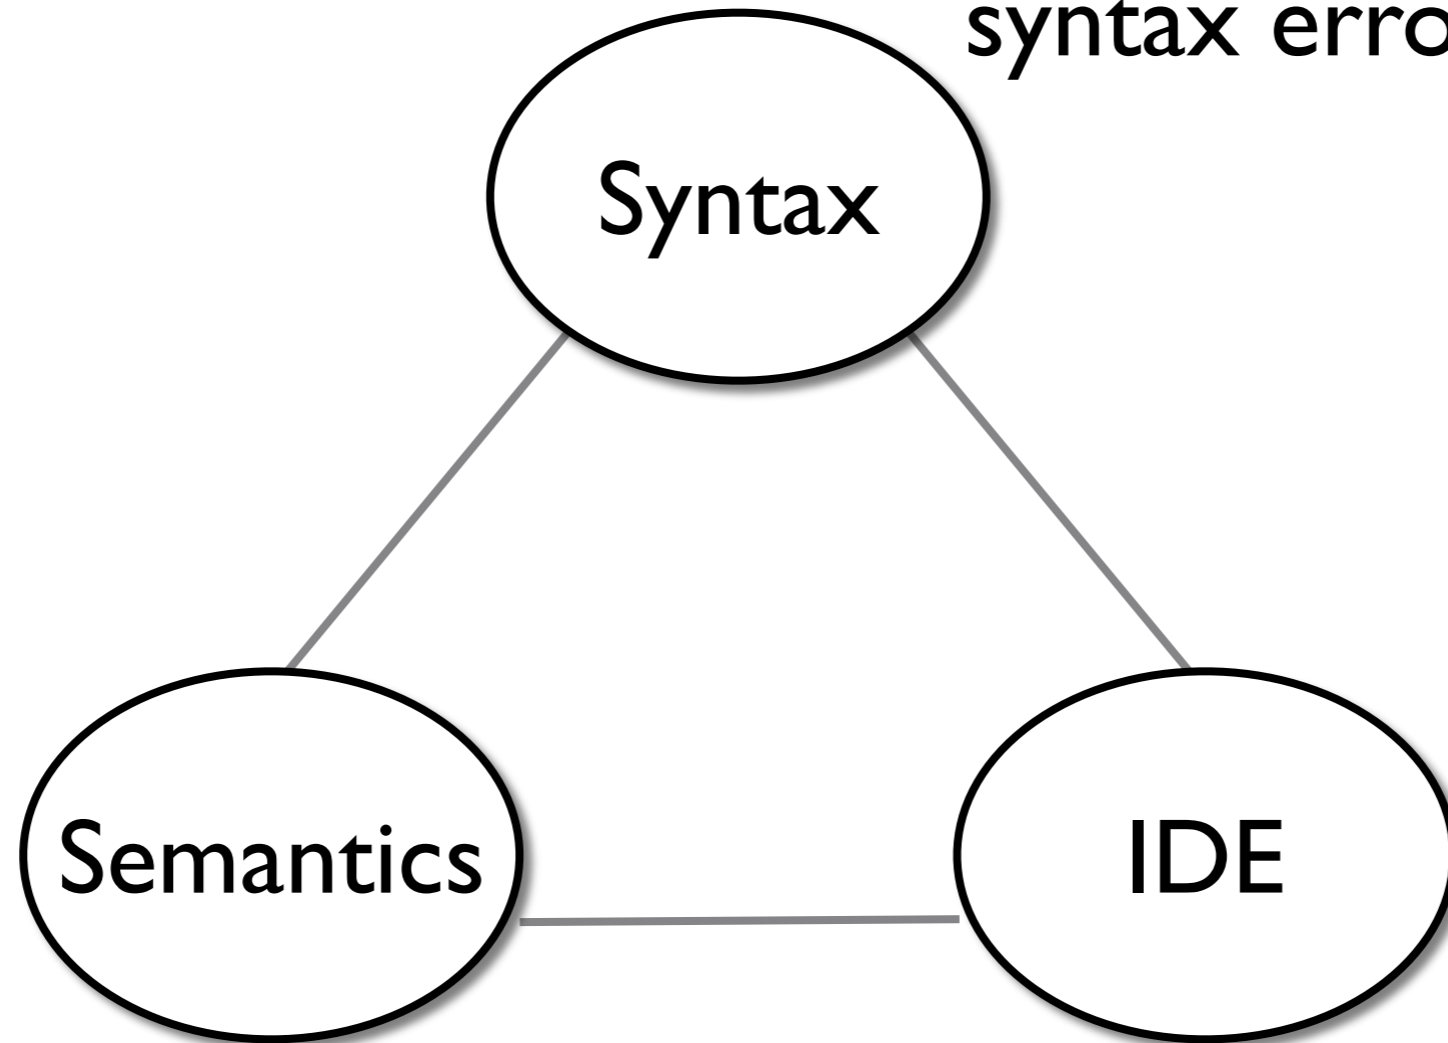

The right editor, titled 'example.ent', contains the following code:

```
module example
  entity User {
    name      : String
    password  : String
    homepage  : URL
  }
  entity BlogPosting {
    poster : User
    body   : String
  }
  entity URL {
    location : String
  }
```

A mouse cursor is hovering over the [URL](#) hyperlink in the 'User' entity definition.

“DOES THIS HYPERLINK POINT TO THE RIGHT PLACE?”

How to test language services?

IMPLEMENT
FEATURE, TEST WITH
EXAMPLE

DOESN'T WORK

CLOSE ENOUGH.

DISCARD
TEST

How can we
systematically test
language definitions?

General-Purpose Testing Tools?

A Test Input

```
module Example
```

```
function foo() {  
    bar();  
}
```

```
function bar() {  
  
}
```

Another Test Input

```
module Example
```

```
function foo() {  
    foo();  
}
```

```
function bar() {  
  
}
```

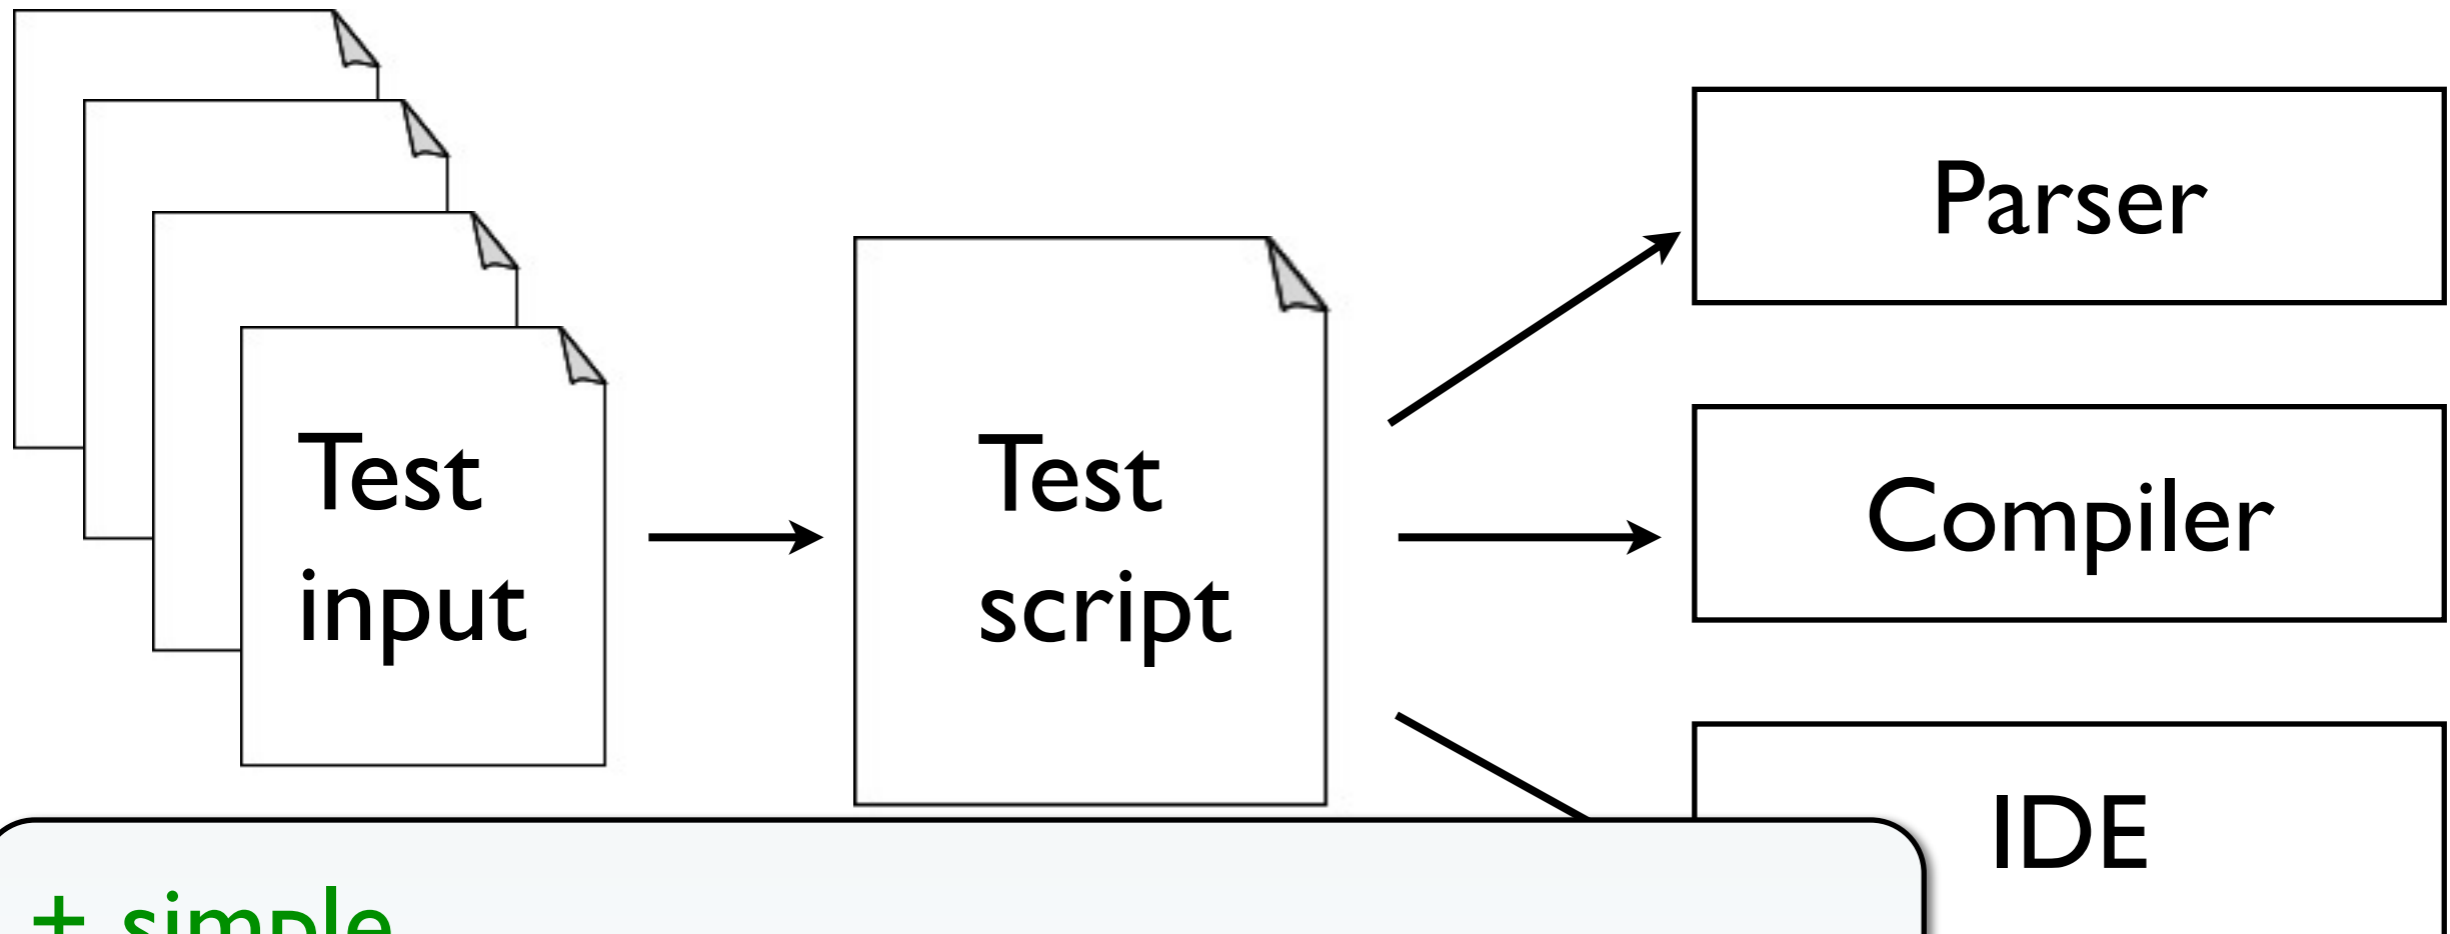

A Negative Test Case

```
module Example
```

```
function foo() {  
    baz();  
}
```

```
function bar() {  
  
}
```

Automated Testing Infrastructure

+ simple

- language-specific script
- limited expressiveness
- boilerplate code
- ...

Can we design a ***general***
solution for specifying
language tests?

Yes We Can

Generic test specification language

+

Parametrization

Language-Parametric Testing Language (LPTL)

```
module my-tests
```

```
language mob1
```

```
test Cannot assign an integer to a string [[
```

```
module Example
```

```
function test() {  
  var s : String = 1;  
}
```

```
]] 1 error
```

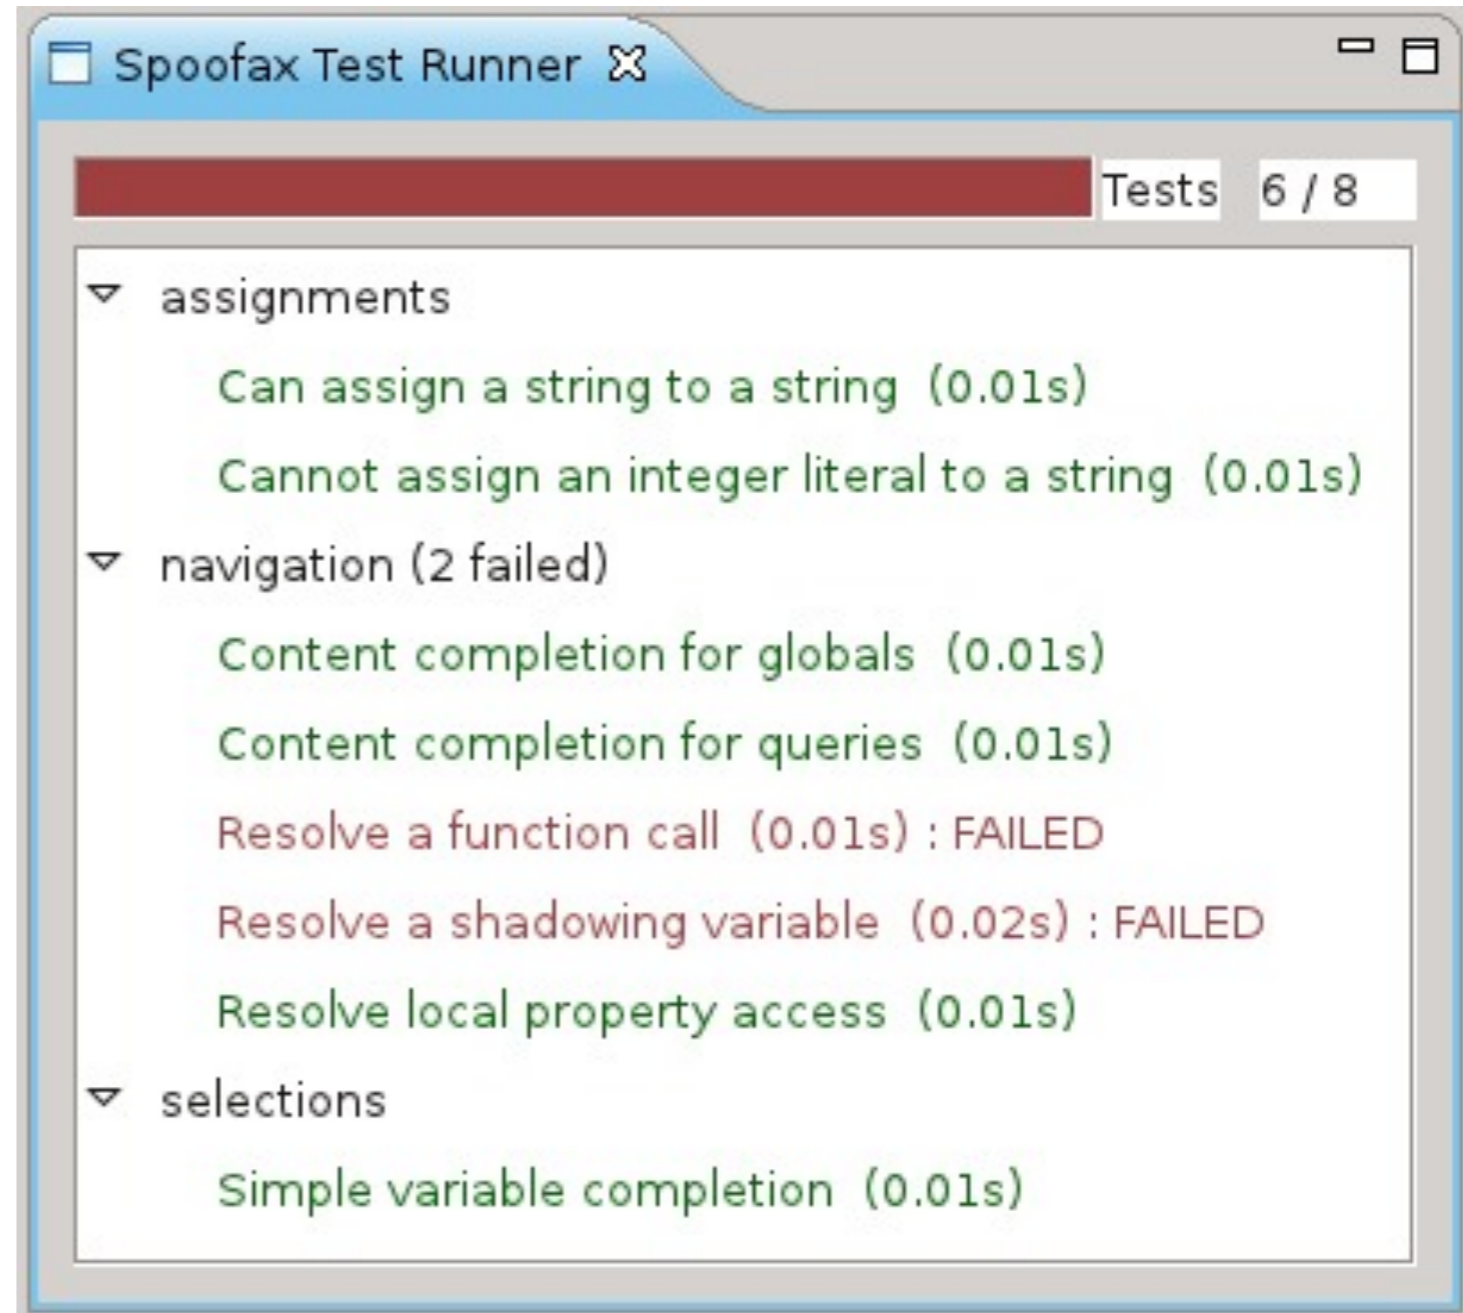

LPTL Opportunities

Expressiveness

Tool support

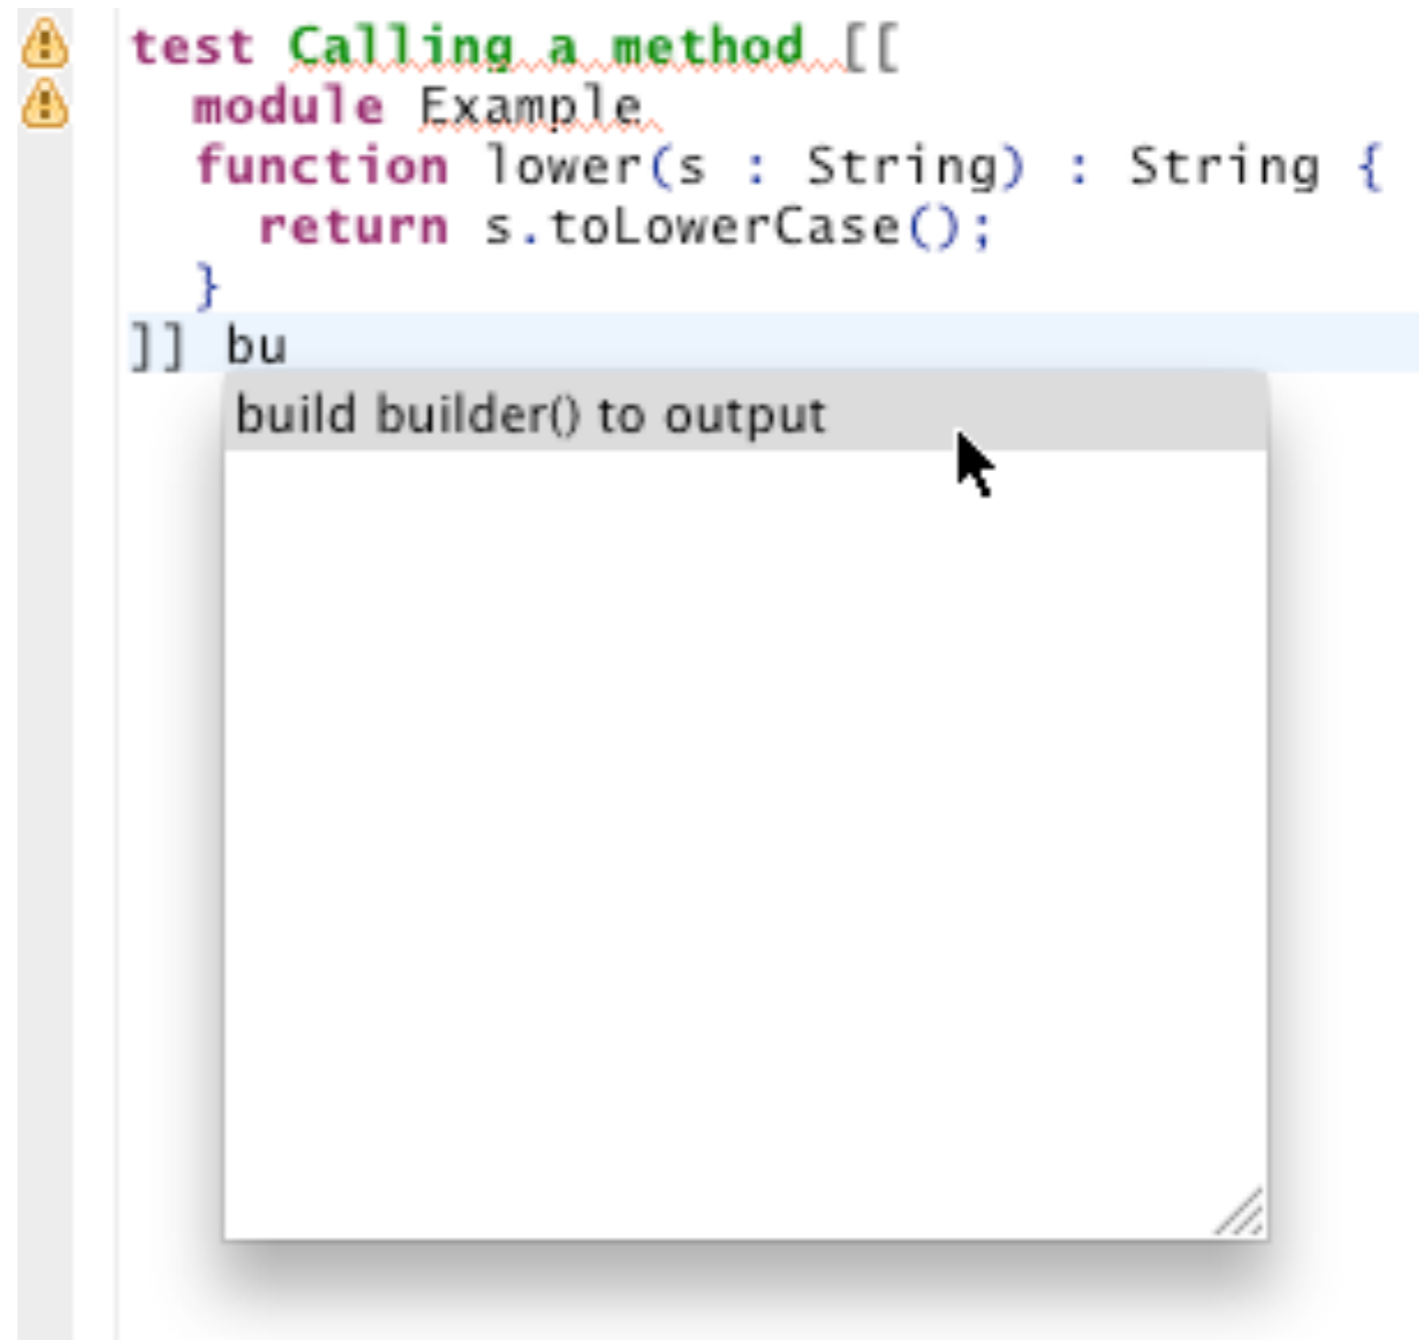

LPTL Opportunities (1)

Module system
+
GUI Test Runner

LPTL Opportunities (2)

IDE support
for test
specifications

```
test Calling a method [[
  module Example
  function lower(s : String) : String {
    return s.toLowerCase();
  }
]] bu
```

build builder() to output

LPTL Opportunities (3)

Immediate
test
evaluation

The screenshot shows a code editor with two tabs. The top tab, titled '*1-syntax.spt', contains the following LPTL code:

```
module syntax
  language Calculang

  test Add [[
    1 + 2
  ]] parse succeeds

  test Multiply [[
    1 * 2
  ]]
```

The 'test Multiply' block has a yellow warning icon and a red 'x' icon next to it, indicating a failure. The expression '1 * 2' has red wavy lines under the asterisk and the number '2', suggesting a parsing error.

The bottom tab, titled 'Calculang.sdf', shows the grammar rules for the language:

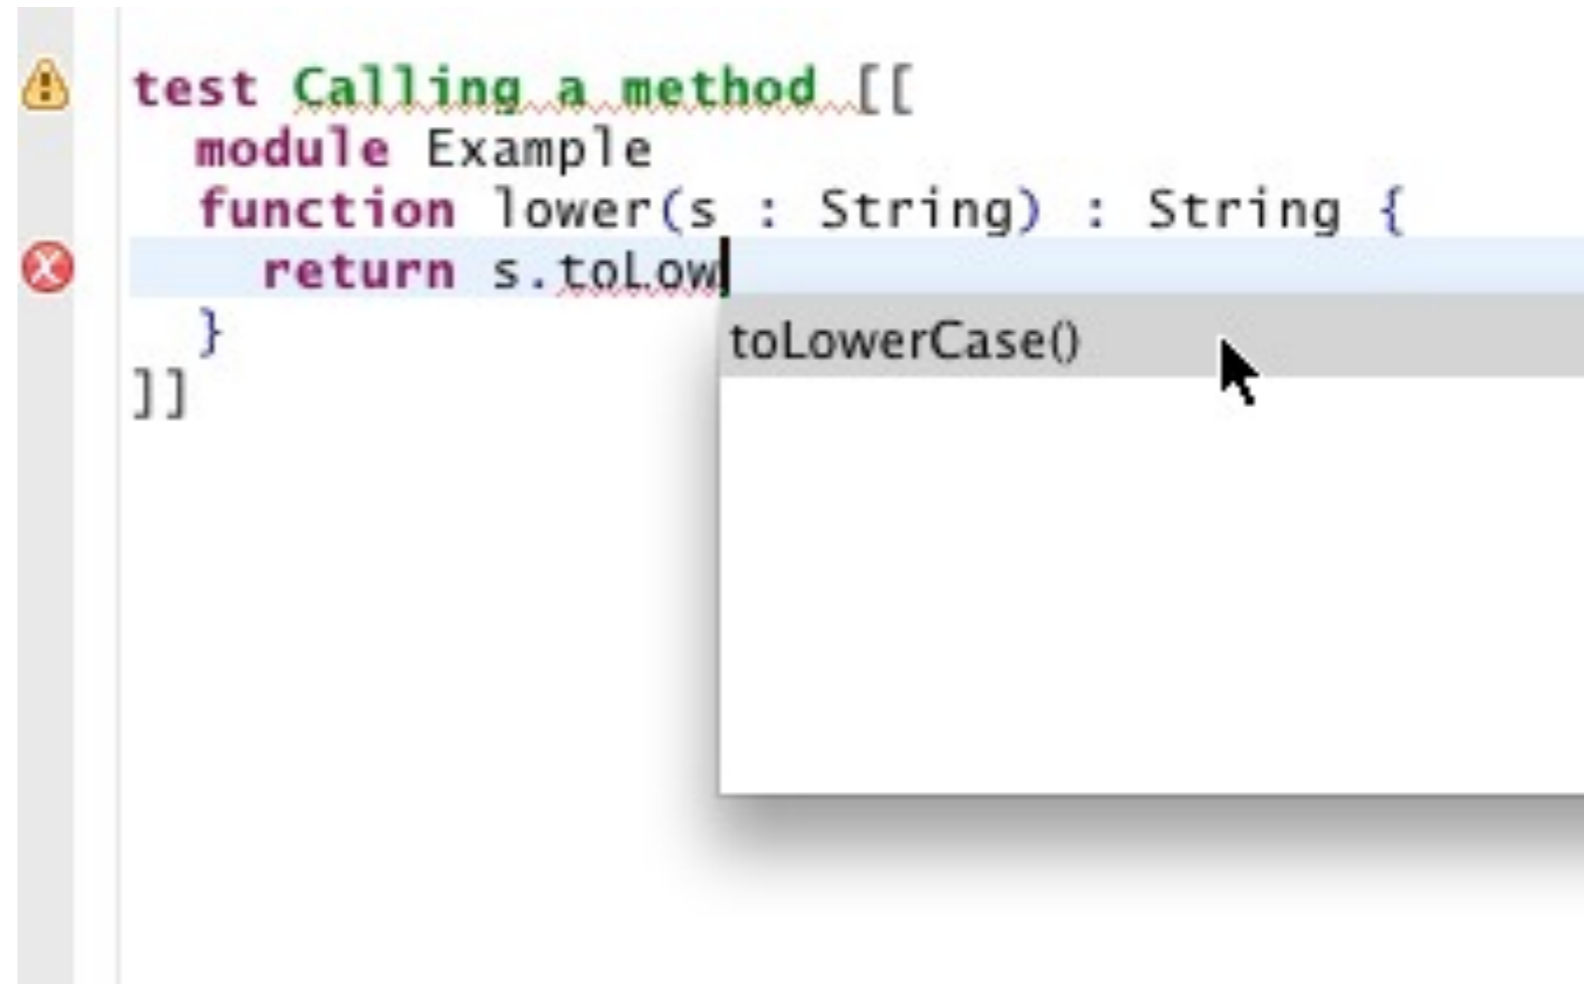

```
context-free syntax

  INT -> Exp {cons("Int")}

  Exp "+" Exp -> Exp {cons("Plus")}
```

LPTL Opportunities (4)

IDE support
for test
inputs

The screenshot shows an IDE window with a code editor. The code is as follows:

```
test Calling a method [[  
  module Example  
  function lower(s : String) : String {  
    return s.toLow|  
  }  
]]
```

A tooltip is visible over the `s.toLow` text, showing the method `toLowerCase()`. The tooltip has a grey background and a mouse cursor pointing to the text.

LPTL Opportunities (5)

Reduced
boilerplate

```
setup [[  
  module Example
```

```
  imports stuff
```

```
  function test() {  
    [[...]]  
  }
```

```
]]
```

```
test Cannot assign ... [[  
  var s : String = 1;  
]] 1 error
```

LPTL Opportunities (6)

1 **error**

2 **warnings**

/expected here/

parse fails

complete ... to ...

resolve ... to ...

refactor ... to ...

build ...

run ...

Wide set of
test conditions

Testing Syntax (1)

```
test Proper declaration [[  
    var s : String = "a";  
]] parse
```

```
test Java-like declaration [[  
    String s = "a";  
]] parse fails
```

Testing Syntax (2)

```
test Proper declaration [[  
    var s : String = "a";  
]] parse to VarDecl("s", _)
```

```
test Precedence [[  
    3 + 1 * 2  
]] parse to [[  
    3 + (1 * 2)  
]]
```

Testing Error Markers

```
test Variable declaration [[  
    var s : String = "a";  
]] 0 errors
```

```
test Bad variable declaration [[  
    var s : String = 25;  
]] 1 error /wrong type/
```

Testing References

```
test [[
  module Example

  function foo() {
    [[bar]]();
  }

  function [[bar]]() {

  }
]] resolve #1 to #2
```

Testing Code Generation..?

```
test [[  
  function foo() {  
    return 3;  
  }  
]] build generate-javascript to [[  
  var foo = function foo() {  
    return 3;  
  };  
]]
```

Testing Execution

```
setup [[  
  application execution  
  
  function test() : Num {  
    // init  
    [[...]]  
  }  
]]
```

```
test Arithmetic [[  
  return 1 + 1;  
]] run run-test to 2
```

Implementation

Spoofox Testing Language

(spoofox.org)

Implementation Techniques

Language embedding

Dynamic instantiation of language services

Language Embedding: Syntax

```
1 module tests  
2 language mob1  
3 test Java-like declaration [[  
   String s = "a";  
]] parse fails
```

Language Embedding: Semantics & IDE (1)

```
test A function call [[  
  function foo() {  
    }  
fo |  
]]
```

Content complete

Mobl

Language Embedding: Semantics & IDE (2)

```
test A function call [[  
  function foo() {  
  }  
  notfoo();  
]]
```

Mobl

No condition;
error not expected

Dynamic Language Service Instantiation

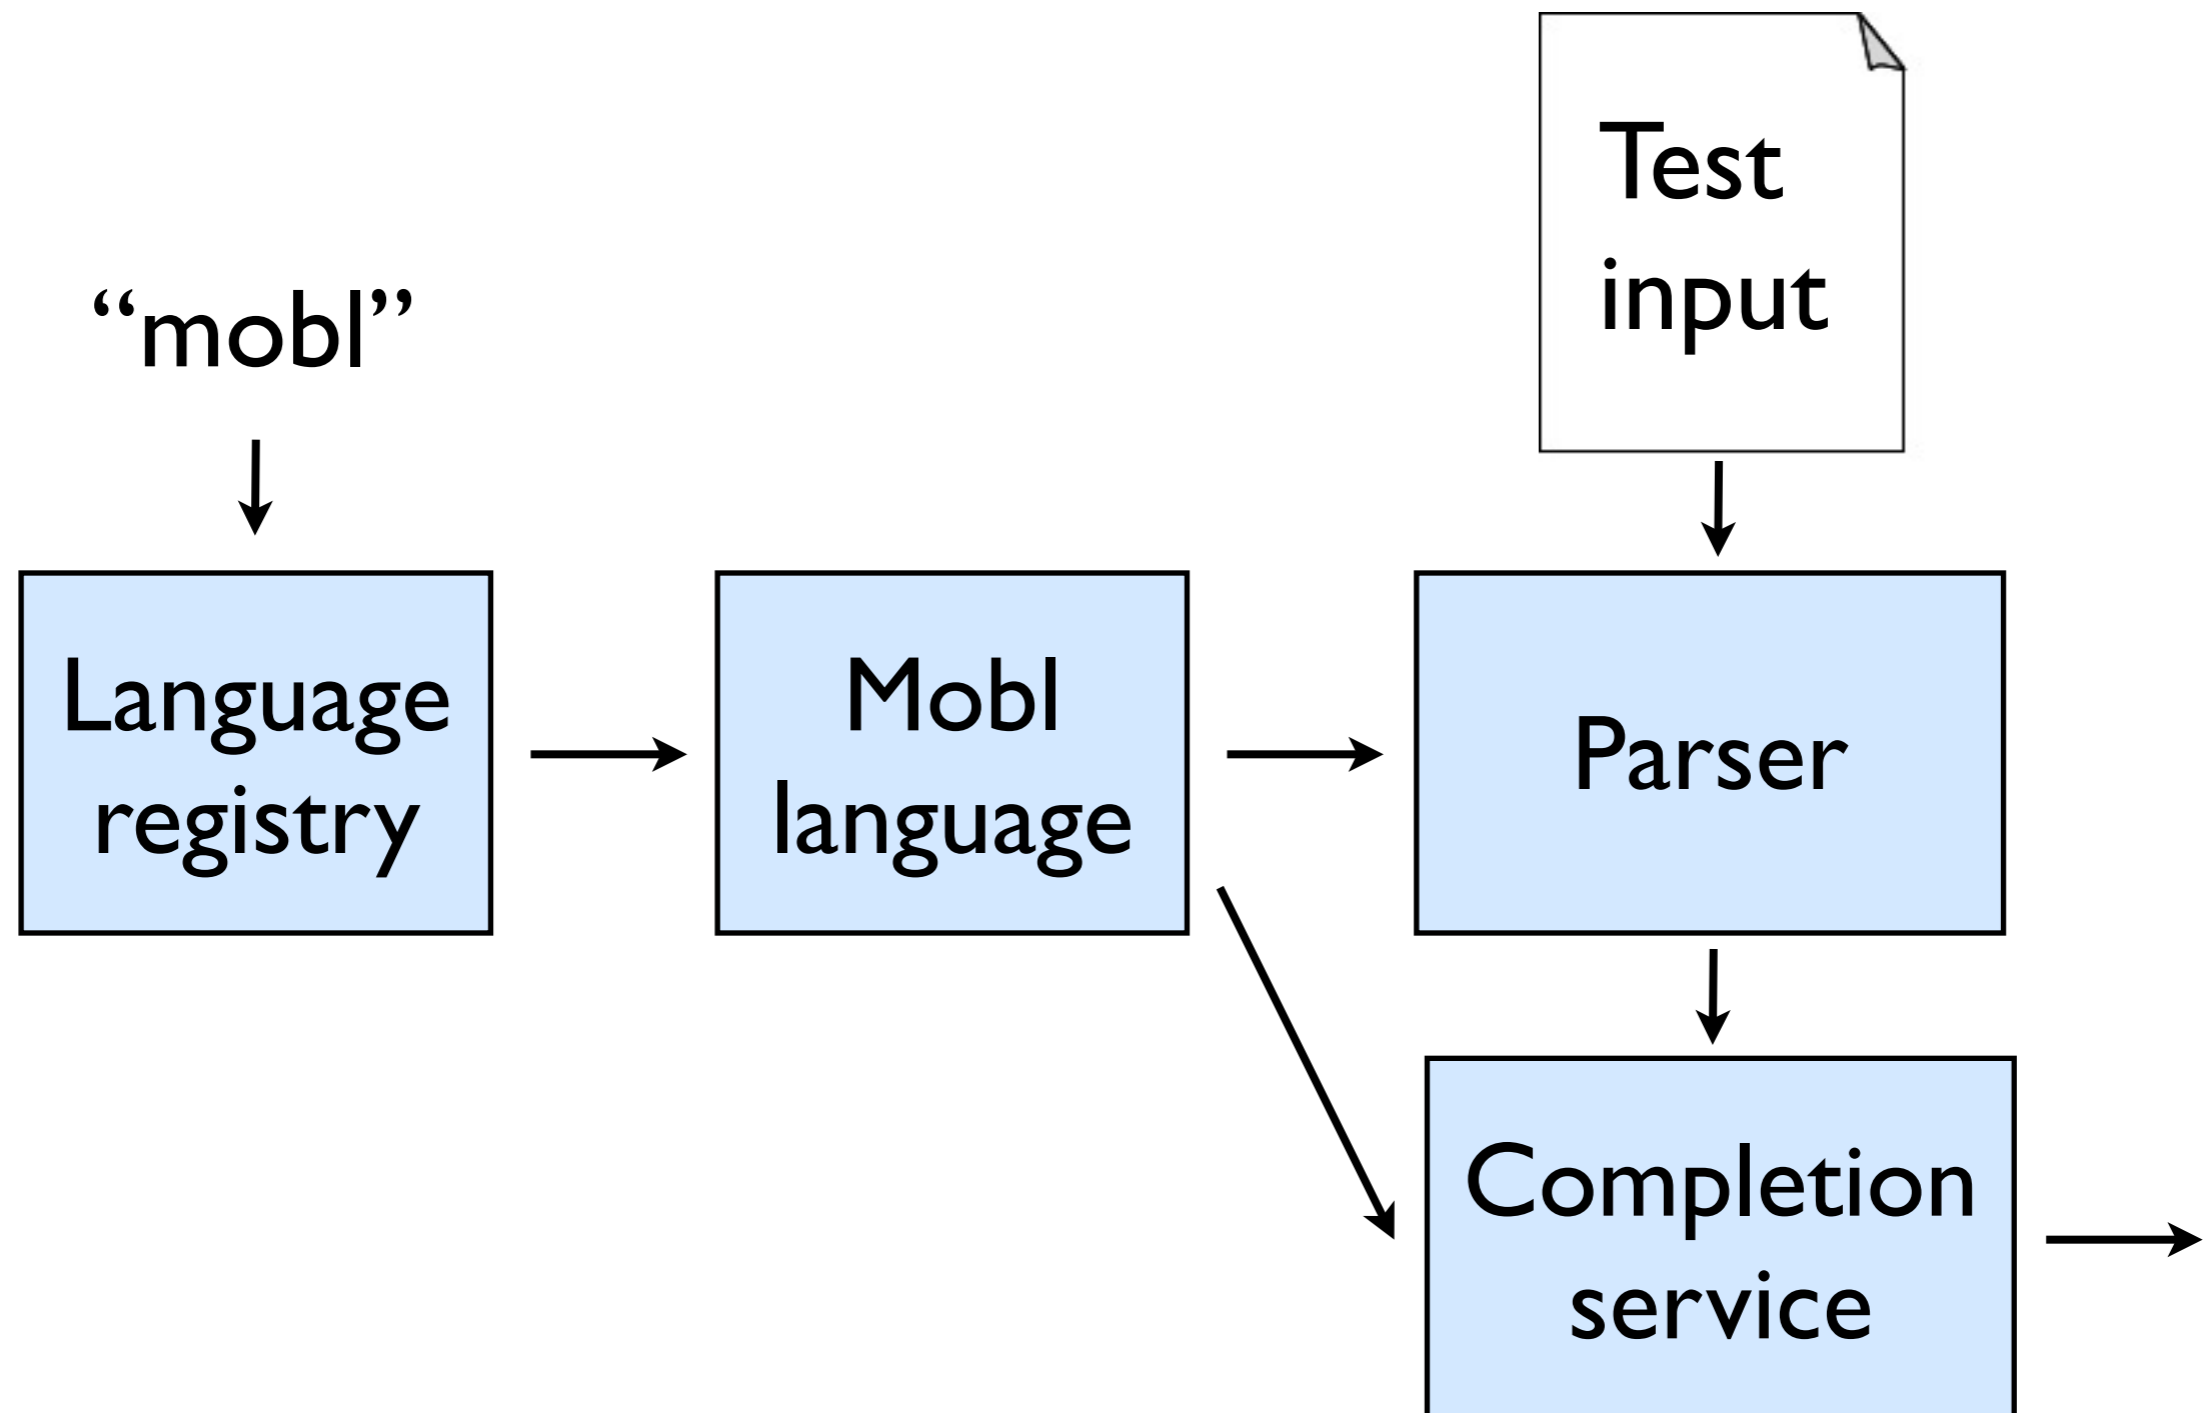

Dynamic Language Service Instantiation

Language registry

Language consists of services

Services have *functional* interfaces

Dynamic Language Service Instantiation

Reflection

- + simple
- + no scripting required
- + IDE helps avoid errors
- + little boilerplate code
- + expressiveness

Conclusions

- General abstraction for language testing
- Explored opportunities in expressiveness and tool support

ADDITIONAL
SLIDES

Related:

Automatic Test Generation

- Generate tests from grammar
- Requires oracle
- Complementary to our approach

Self-Application

Language Spooifax-Testing

```
test Testing testing [[[  
  Language Mob]  
  test Testing [[  
    module y  
  ]]  
]]]
```
